# Draft Project Spec 2026

Rem & Mahjabin

# Core Requirements

- Minimum Requirements: 3 services (1 per team member) – but you judge based on what you are trying to achieve.
  - 3 simple microservices is not an excellent project.
- 3rd Party Content is allowed, but external services are not counted as one of the 3 minimum services.
- Use of other technologies is a bonus.
  - Kubernetes is not considered an extra technology because many of you learnt it for Cloud Computing.
- Any technology stacks can be used, but must be motivated / explained in the report.
- LifeCo would be a C grade at best.

# Marking Scheme

| | Proposal / Architecture (20%) | Implementation (50%) | Report (20%) | 5 Minute Video (10%) |
|---|---|---|---|---|
| A | Problem requires Distribution / Excellent Architectural Design | Excellent Implementation that Incorporates Scalability and Fault Tolerance (Here I want design patterns to be used ) | Excellent Report includes that includes comprehensive reflection on the changes since the proposal. | Excellent video that demonstrates the operation of the system including scalability / fault tolerance. |
| B | Problem requires Distribution / Very Good Architectural Design but minor issues. | Very Good Implementation that incorporates Scalability and Fault Tolerance. | Very Good Report that includes reflection on the main changes from the proposal. | Very good vide that demonstrates the operation of the system with some focus on scalability and fault tolerance. |
| C | Problem would benefit from Distribution / Good Architectural Design | Complete Implementation that Incorporates some Scalability and Fault Tolerance. | Good report that includes some reflection. | Good video that demonstrates the operation of the system and covers scalability or fault tolerance |
| D | Problem could benefit from | Good attempt at Implementation / May | Submitted a report that describes the implemented | Video demonstrates the operation of the system. |

# Report Contents

- Title Page:
  - Team Name
  - Team Members & Student Numbers
  - Link to Git Repo
- Sections:
  - Proposal Submission (unchanged)
  - Final Architecture & Description of Services / Technology Stack
  - Who did what?
  - How is Scalability / Fault Tolerance addressed?
  - Reflection on Experience (what changed from the Proposal to the submitted system).

# Video Requirements

- Max duration (5 mins)

- Key Parts:
  - Clear demonstration of system operation
  - Illustration of how scaling works
  - Illustration of how fault tolerance works

# Git Repo

- All source code
- Link to Report and Video
- README.md should explain how to deploy the system
  - Requirements + Steps
